

SELF DRIVE CAR BOOKING SYSTEM

ABSTRACT

The **Self-Drive Car Booking System** is a peer-to-peer vehicle sharing platform designed to bridge the gap between car owners and individuals in need of short-term transportation. This project aims to create a secure, user-centric, and fully functional web-based marketplace where vehicle owners can list their cars for rent and renters can seamlessly search, select, and book vehicles based on their preferences and requirements. The system facilitates two primary user journeys. The Car Owner Module, which enables users to register, verify their identity, and list vehicles with detailed specifications such as make, model, year, condition, and pricing. The Renter Module, which provides an intuitive interface for searching and filtering available cars, checking availability via geolocation, and completing secure bookings. Key features of the platform include user registration with identity verification, a car listing management system, real-time search and filter options, booking and reservation handling. The responsive design ensures seamless user experience across devices, promoting trust and transparency between users while streamlining the car-sharing process. This solution not only provides a practical alternative to traditional car rentals but also promotes sustainable mobility through optimized vehicle utilization.
